PROJECTS

Quantitative Risk Modeling - Portfolio VaR Optimization HEC Lausanne Sep. - Dec. 2024

- Built a GARCH-based Monte Carlo framework to estimate Value at Risk (VaR) and compare portfolio strategies (MVO vs. Equal-Weight).
- Assessed tail risk, volatility clustering, and fat-tail effects using S&P 100 data, enhancing portfolio risk accuracy under stress conditions.
- Tools: Python, R, Monte Carlo Simulation, GARCH(1,1)

Asset Allocation with a Carbon Objective HEC Lausanne Mar. - Jun. 2025

- Built a Python framework integrating carbon emission limits into MVP optimization with rolling 10-year windows
- Developed carbon-active/passive strategies for 50% emissions cuts and a net zero trajectory
- Back-tested and reported financial and environmental metrics (annual return, volatility, Sharpe ratio, carbon emission)

Portfolio Optimization & Sentiment Analysis Project HEC Lausanne Sep. - Dec. 2025

- Implemented Markowitz mean-variance optimization, Black-Litterman model, risk parity (ERC), and resampling techniques in Python to analyze performance and constraint effects.
- Launch an investment web for investors who have different preference and risk aversion.
